

# C PROGRAMING

*Ketan Kore*

**Sunbeam Infotech**

# String

- String is character array terminated with '\0' character.
  - '\0' is character with ASCII value = 0.

- Example :

```
char arr[5] = "abcde";  
int j;  
for(j=0; j<5; j++)  
    printf("%c",arr[ j ]);
```

- String input/output

- char str[20];
- scanf("%s",str); /\*Input\*/
- printf("%s",str); /\*Output\*/
- gets(str); /\*Input\*/
- puts(str); /\*Output\*/
- scanf("%[^\n]", str); // scan whole line

# String functions

- C library have many string functions.
- They are declared in string.h
  - `strlen()` – `size_t strlen(const char *s);`
  - `strcpy()` – `char* strcpy(char *dest, const char *src);`
  - `strcat()` – `char* strcat(char *dest, const char *src);`
  - `strcmp()` – `int strcmp(const char *s1, const char *s2);`
  - `strcmpi()` - `int strcmpi(const char *s1, const char *s2);`
  - `strchr()` – `char* strchr(const char *s, int ch);`
  - `strstr()` – `char* strstr(const char *s1, const char *s2);`
  - `strrev()` – `char* strrev(char *s);`

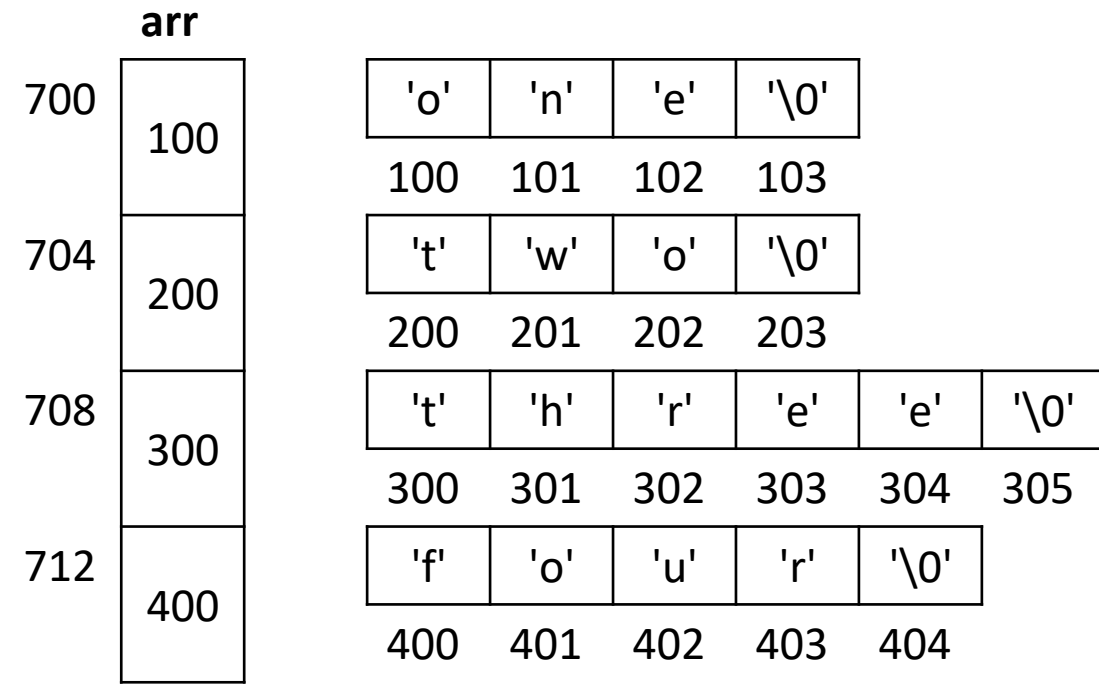

# NULL pointer

- If pointer is uninitialized, it will hold garbage address (local pointer variables).
- Accessing such pointer may produce unexpected results. Such pointers are sometimes referred as wild pointers.
- C defined a symbolic const NULL, that expands to (void\*)0.
- It is good practice to keep well known address in pointer (instead of garbage).
- NULL is typically used to initialize pointer and/or assign once pointer is no more in use.
- Many C functions return NULL to represent failure.
  - strchr(), strstr(), malloc(), fopen(), etc.

# Array of pointers

```
char *arr[] = { "one", "two", "three", "four" };  
for(i = 0; i < 4; i++)  
    puts(arr[i]);
```

# Command line arguments

- Command line arguments are information passed to the program while executing it on command line.
- cmd> a.exe one two three four

```
int main(int argc, char *argv[]) {  
    int i;  
    for(i=0; i < argc; i++)  
        puts(argv[i]);  
    return 0;  
}
```

# void pointer

---

- Void pointer is generic pointer it can hold address of any data type (without casting).
- Scale factor of void\* is not defined, so cannot perform pointer arithmetic.
- To retrieve value of the variable need type-casting.
- void\* is used to implement generic algorithms.

# 2-D array

- Logically 2-D array represents m x n matrix i.e. m rows and n columns.
  - `int arr[3][4] = { {1, 2, 3, 4}, {10, 20, 30, 40}, {11, 22, 33, 44} };`
- Array declaration:
  - `int arr[3][4] = { {1, 2, 3, 4}, {10, 20, 30, 40}, {11, 22, 33, 44} };`
  - `int arr[3][4] = { {1, 2 }, {10}, {11, 22, 33 } };`
  - `int arr[3][4] = { 1, 2, 10, 11, 22, 33 };`
  - `int arr[ ][4] = { 1, 2, 10, 11, 22, 33 };`

	0	1	2	3
0	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>
1	<b>10</b>	<b>20</b>	<b>30</b>	<b>40</b>
2	<b>11</b>	<b>22</b>	<b>33</b>	<b>44</b>

Thank you!
